Background: In 7/00, a 6-mth trial of on-site DC tx was initiated at a military hospital in Nova Scotia. 2 DC’s provided all DC care on an outpatient basis and by MD referral. The DC’s were “free to employ any treatment they deemed appropriate”: joint manipulation (spine/extremities), soft tissue massage, stretches & home exercise, and interferential and acupuncture. Study background: Starting in 9/00, consecutive pts over a 6-wk period were invited to fill out an anonymous “satisfaction” data. Data on 69 pts was collected, which was a 68% response rate (69/102). Results: 1) General: a) age/sex of pts: sex – 80% male, age – 37 yoa, avg.; b) most common presenting complaints (pts could have more than one): LBP – 36%, LBP w/ radiation – 30%, neck pain and/or HA – 32%, mid-back pain – 26%; c) duration of sx: yrs since first episode – 6 yrs, avg.; current episode duration: acute (< 3 mths) – 41% of pts, subacute (3-6 mths) – 3%, chronic (> 6 mths) – 56%; 2) Pt satisfaction: a) “I am satisfied with the care I received”: agree – 94%, unsure – 6%; b) “The care I received was just about perfect”: agree – 87%, unsure – 12%; c) “I would recommend this chiropractor to a friend or relative”: agree – 97%, unsure – 1%. Conclusion: “The large majority of respondents (94.2%) were satisfied with their chiropractic care...” “...our findings of high satisfaction with chiropractic services is encouraging...” Other: The 12 referring physicians were mailed a questionnaire on their satisfaction approx. 5 mths into the 6-mth trial period. “The majority were satisfied with chiropractic services provided...” – 83% (10/12; 2 were “unsure” d/t not having “been involved with the pilot project long enough to provide comment”).
Are chiropractic patients satisfied with their results?
